ACKNOWLEDGEMENT

First of all, we thank the almighty for providing us strength and courage to present the project. We avail this opportunity to express our sincere gratitude towards **Prof. Chintan N. Kanani, Head of Computer Engineering Department** for permitting us to conduct the project.

We express our cavernous sense of obligation and gratitude to our Guide **Prof.Akash N. Siddhpura** for his genuine guidance and constant encouragement throughout this project work. We are highly obliged to our honorable guide for providing us with such an opportunity to carry out research work under his continuous guidance.

Also, we are very thankful to Darshan University Computer Department faculties who supported us in getting our website ready. We also wish to express our heartfelt appreciation to our family, colleagues and many who have rendered their support for the successful works towards the completion of the research work, both explicitly and implicitly.

We also thank to our friends who suggested right way for the improvement of our project, they gave us complete support for the construction of our project according to guideline. We deeply acknowledge mutually to all project supporter for their never-ending encouragement, moral support and patience during the preparation of this project.

Student Name	**Enrollment Number**
Kadeval Ruchit M.	23020201075
Kansagara Yug D.	23020201082
Lila Darshan B.	23020201093
Sakariya Yug J.	23020201138

ABSTRACT

The **Interview Question Portal** is a simple and user-friendly web application designed to help students and job seekers prepare for interviews in an organized way. This portal allows users to view interview questions based on different categories such as Java, HR, Flutter, and other technologies. Users can also explore questions asked by specific companies to understand real interview patterns. Important questions can be bookmarked so that users can revise them later easily.

The portal also provides quiz and mock test features, where users can attempt tests to check their knowledge and improve their confidence. After submitting a test, users can see their results immediately, which helps them understand their strengths and weaknesses. Users can also view their past test history to track progress over time.

On the admin side, the system allows easy management of categories, companies, and interview questions. Admins can create and manage quizzes, assign questions to tests, and view user performance reports. This helps maintain quality content and improve the learning experience.

Overall, the Interview Question Portal is an effective platform that supports interview preparation through structured content, practice tests, and performance analysis in a simple and efficient manner.

1. INTRODUCTION

1.1 PROBLEM SUMMRY

1.1.1 Problem Identification

Many students and job seekers struggle with interview preparation due to the absence of a single, organized platform for practice. Interview questions are spread across multiple sources, making it difficult to find questions based on specific categories like Java, HR, or Flutter, or based on particular companies. This unstructured approach leads to confusion, wasted time, and incomplete preparation.

Additionally, most learners do not have access to proper mock tests or quizzes that provide instant feedback. Without immediate results and performance analysis, users cannot identify their weak areas or track their improvement over time. The lack of a bookmarking feature also makes it hard to save and revise important questions.

From an administrative perspective, managing interview content manually is time-consuming and inefficient. There is no easy way to organize categories, companies, questions, and test results in one system.

These challenges highlight the need for a centralized, user-friendly interview preparation portal that offers structured content, practice tests, instant results, and efficient content management.

1.1.2 Problem Solution

The Interview Question Portal provides an effective and organized solution to the challenges faced by students and job seekers during interview preparation. It acts as a centralized platform where users can easily access interview questions categorized by technology and company, reducing time spent searching across multiple sources.

The portal includes a bookmarking feature that allows users to save important questions for quick revision. It also offers quizzes and mock tests to help users practice

in a real interview-like environment. Instant test results and detailed performance feedback enable users to identify strengths and weak areas immediately. The test history feature helps users track their progress over time and improve continuously.

For administrators, the system offers easy management of categories, companies, questions, and quizzes through a structured interface. Admins can create tests, assign questions, and analyze user performance efficiently.

Overall, this solution improves interview readiness by combining structured learning, regular practice, instant evaluation, and efficient content management in one simple and user-friendly platform.

2. PLANNING

2.1 MODEL DESCRIPTION

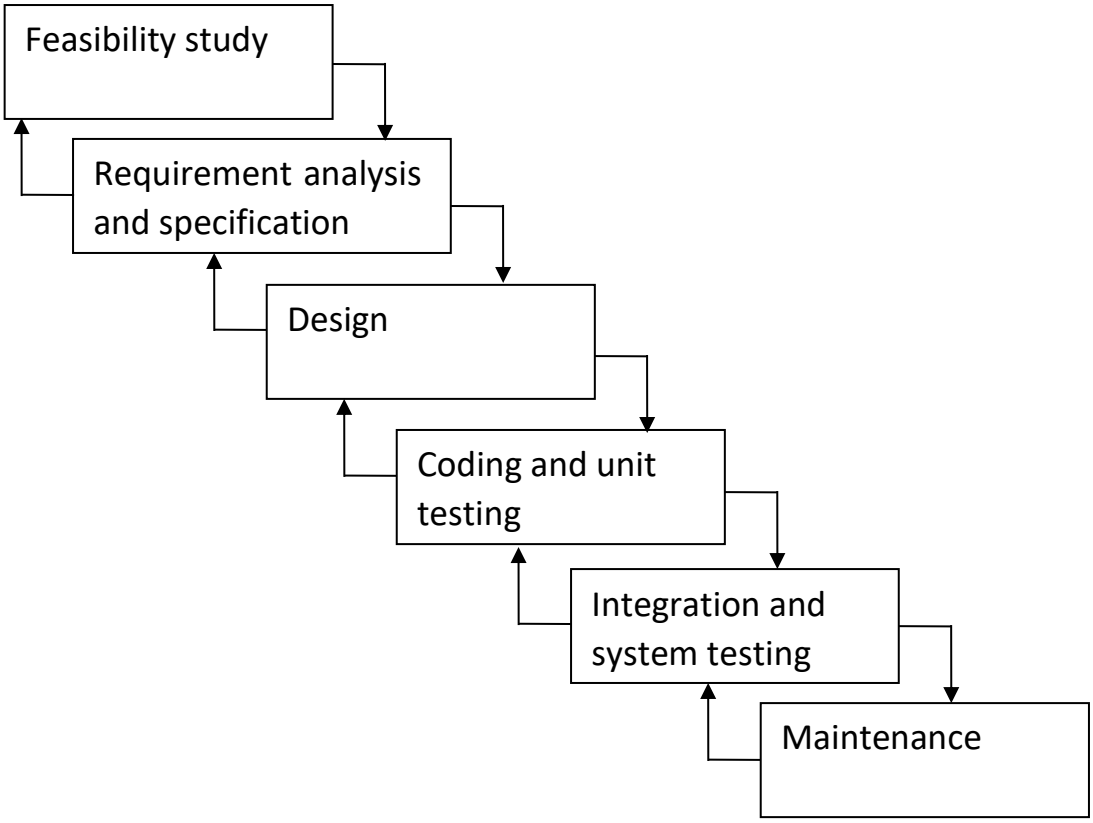

Fig 2.1 Iterative Waterfall Model

- In our project we are using iterative waterfall model.
- It is not possible to strictly follow the classical waterfall model.
- Making necessary changes to the classical waterfall model so that it becomes applicable to practical software development projects.
- The main change to the classical waterfall model is in the form of providing feedback paths from every phase to its preceding phases as shown in figure.
- The feedback paths allow for correction of the errors committed during a phase as and when these are detected in a later phase.
- For example, if during testing a design error is identified then the feedback path allows the design to be reworked and the changes to be reflected in the design document.
- There is no feedback path to the feasibility stage. This means that the feasibility study errors cannot be corrected.

Requirements analysis and specification

- The aim of the requirements analysis and specification phase is to understand the exact requirements of the customer and to document them properly. This phase consists of two distinct activities, namely
  - Requirements gathering and analysis, and
  - Requirements specification
- The goal of the requirements gathering activity is to collect all relevant information from the customer regarding the product to be developed. This is done to clearly understand the customer requirements so that incompleteness and inconsistencies are removed.
- The requirements analysis activity is begun by collecting all relevant data regarding the product to be developed from the users of the product and from the customer through interviews and discussions.
- During SRS activity, the user requirements are systematically organized into a Software Requirements Specification (SRS) document.

Design

- During the design phase the software architecture is derived from the SRS document. Two distinctly different approaches are available.
- Traditional design consists of two different activities; first a structured analysis of the requirements specification is carried out where the detailed structure of the problem is examined. During structured design, the results of structured analysis are transformed into the software design.

Coding and unit testing (Implementation)

- The purpose of the coding and unit testing phase of software development is to translate the software design into source code. Each component of the design is implemented as a program module. The end-product of this phase is a set of program modules that have been individually tested.
- Each module is unit tested for determine the correct working of all the individual modules.

Integration and system testing

- Integration of different modules is done once they have been coded and unit tested. During the integration and system testing phase, the modules are integrated in a planned manner.
- Finally, when all the modules have been successfully integrated and tested, system testing is carried out. The goal of system testing is to ensure that the developed system conforms to its requirements laid out in the SRS document. System testing usually consists of three different kinds of testing activities.
- α – testing: It is the system testing performed by the development team.
- β – Testing: It is the system testing performed by a friendly set of customers.
- Acceptance testing: It is the system testing performed by the customer himself after the product delivery to determine whether to accept or reject the delivered product.

Maintenance

- Maintenance involves performing any one or more of the following three kinds of activities:
  - Correcting errors that were not discovered during the product development phase. This is called corrective maintenance.
  - Improving the implementation of the system, and enhancing the functionalities of the system according to the customer's requirements. This is called perfective maintenance.
  - Porting the software to work in a new environment. For example, porting may be required to get the software to work on a new computer platform or with a new operating system. This is called adaptive maintenance.

2.2 Risk Management

- The aim of risk management is to reducing the impact of all kind of risks that might affect a project. Risk management consists of three essential activities: risk identification, risk assessment, and risk containment.

Risk Identification

- A software project can be affected by a large variety of risks. In order to be able to systematically identify the important risks which might affect a software project, it is necessary to categorize risks into different classes.
- The project manager can then examine which risks from each class are relevant to the project. There are three main categories of risks which can affect a software project:

Project Risks

- Project risks concern varies forms of budgetary, schedule, personnel, resource, and customer-related problems. An important project risk is schedule. It is very difficult to monitor and control a software project.
- It is very difficult to control something which cannot be seen.
- The invisibility of the product being developed is an important reason for many software projects failure.
- So in our project we are trying to resolve this kind of project risk which is also known as schedule risk.

Technical Risks

- Technical risks concern design, implementation, interfacing, testing, and maintenance problems.
- Technical risks also include ambiguous specification, incomplete specification, changing specification, technical uncertainty. Most technical risks occur due to the team member's insufficient knowledge about the project.
- So in order to prevent this risk, we have done appropriate project analysis before starting our project.

Business Risks

- This type of risks include risks of building an excellent product that no one wants, losing budgetary or personnel commitments, etc.

Risk Assessment

- Risk assessment involves identifying risk, analyzing them and then assigns priority to them on the basis of the analysis.
- The objective of risk assessment is to rank the risks in terms of their damage. For risk assessment, first each risk should be rated in two ways:
- The probability of a risk coming true (denoted as r).
- The result of the problems associated with that risk (denoted as s).
- Based on these two factors, the priority of each risk can be computed:

$$\mathbf{p = r * s}$$

- Where, p is the priority with which the risk must be handled, r is the probability of the risk becoming true, and so is the result of damage caused due to the risk becoming true. If all identified risks are prioritized, then the most likely and damaging risks can be handled first and reject procedures can be designed for these risks.

Risk Containment

- After all the identified risks of a project are assessed, plans must be made to containment the most damaging and the most likely risks.
- Different risks require different containment procedures. In fact, most risks require expertness on the part of the project manager in handling the risk.
- There are three main strategies to plan for risk containment:
  - **Avoid the risk:** This may take several forms such as discussing with the customer to change the requirements to reduce the scope of the work.
  - **Transfer the risk:** This strategy involves getting the risky component developed by a third party.
  - **Risk reduction:** This involves planning ways to containment the damage due to a risk.
- To choose between the different strategies of handling a risk, the project manager must consider the cost of handling the risk and the corresponding reduction in risk.
- For this we may compute the risk leverage of the different risks. Risk leverage is the difference in risk divided by the cost of reducing the risk.
- **Risk leverage = (Risk before reducing - Risk after reducing) / cost of reducing**

3. DETAIL DESCRIPTION

Admin

The "**Admin**" module is designed to store information about system administrators who manage the Interview Question Portal. It contains login credentials and identity details required for secure access. Admins are responsible for managing categories, companies, questions, and tests within the system.

- **Admin_ID:** Unique identifier for each admin.
- **Admin_Name:** Name of the administrator.
- **Admin_EmailID**: Email address of the admin, used for login and must be unique.
- **Admin_Password:** Password used for secure authentication.
- **Remark:** Additional notes related to the admin.

Users

The "**Users"** module stores details of registered users who access the portal for interview preparation. It contains personal and login information required for authentication and test participation.

- **User_ID:** Unique identifier for the user.
- **User_FirstName:** First name of the user.
- **User_LastName:** Last name of the user.
- **User_EmailID:** Email address used for login, must be unique.
- **User_Password:** Password for secure access.
- **Remark:** Additional user-related information.

Categories

The "**Categories"** module stores different interview question categories available in the system, such as Java, HR, and Flutter. It helps organize questions in a structured manner.

- **Category_ID:** Unique identifier for each category.
- **Category_Name:** Name of the category, must be unique.
- **Remark:** Additional information about the category.

Companies

The "**Companies"** module maintains a list of companies whose interview questions are available in the portal. It allows users to view questions company-wise.

- **Company_ID:** Unique identifier for each company.
- **Company_Name:** Name of the company, must be unique.
- **Remark:** Additional notes related to the company.

Questions

The "**Questions"** module stores interview questions along with multiple-choice options and the correct answer. Each question is linked to a specific category and company.

- **Question_ID:** Unique identifier for each question.
- **Category_ID:** References the category of the question.
- **Company_ID:** References the company related to the question.
- **Question_Text:** The actual interview question.
- **OptionA, OptionB, OptionC, OptionD:** Multiple-choice options.
- **CorrectOption:** The correct answer option.
- **Remark:** Additional information about the question.

Tests

The "**Tests"** module stores details of quizzes or mock tests created in the system. It includes test configuration such as duration, total marks, and creation details.

- **Test_ID:** Unique identifier for the test.
- **Test_Name:** Name of the test.
- **Category_ID:** Category related to the test.
- **TotalMarks:** Total marks assigned to the test.
- **DurationMinutes:** Time duration of the test.
- **CreatedBy:** User who created the test.
- **CreatedDate:** Date when the test was created.
- **Remark:** Additional test-related information.

TestQuestions

The "**TestQuestions**" module is used to link questions with specific tests. It allows multiple questions to be assigned to a single test.

- **TQ_ID:** Unique identifier for the test-question mapping.
- **Test_ID:** References the test.
- **Question_ID:** References the question included in the test.
- **Remark:** Additional notes.

TestResults

The "**TestResults"** module stores the performance details of users after completing a test. It helps track scores and analyze user progress.

- **Result_ID:** Unique identifier for each result.
- **Test_ID:** References the attempted test.
- **User_ID:** References the user who attempted the test.
- **Result_Score:** Score obtained by the user.
- **TotalQuestions:** Total number of questions in the test.
- **CorrectAnswers:** Number of correct answers.
- **WrongAnswers:** Number of incorrect answers.
- **Remark:** Additional result-related information.

Bookmarks

The "**Bookmarks"** module stores questions saved by users for future reference. It helps users quickly access important questions.

- **Bookmark_ID:** Unique identifier for each bookmark.
- **User_ID:** References the user who bookmarked the question.
- **Question_ID:** References the bookmarked question.
- **SavedDate:** Date when the question was bookmarked.
- **Remark:** Additional notes related to bookmarks.

7. CONCLUSION

The **Interview Question Portal** is a complete and user-friendly system designed to simplify interview preparation for students and job seekers. It provides a centralized platform where users can access interview questions by category and company, bookmark important questions, and practice through quizzes and mock tests. Instant test results and performance history help users understand their strengths and weaknesses and improve continuously.

The system also offers strong administrative control, allowing admins to manage categories, companies, questions, tests, and user performance efficiently. The well-structured database ensures data accuracy, security, and easy retrieval of information. By combining organized content, practice tests, and performance analysis in one platform, the Interview Question Portal saves time and improves preparation quality.

Overall, this project successfully meets its goal of making interview preparation easy, structured, and effective, helping users gain confidence and perform better in real interviews.

8. FUTURE ENHANCEMENT

The current Interview Question Portal provides structured access to interview questions, quizzes, and results. To improve user experience and make the system more advanced, the following future enhancements can be implemented:

- **AI-Based Question Recommendation:** The system can suggest questions and quizzes based on the user's previous test performance and weak areas.
- **Difficulty Level Classification:** Questions can be divided into Easy, Medium, and Hard levels to help users practice step by step.
- **Timed and Adaptive Mock Test:** Mock tests can include time limits, and question difficulty can adjust based on user answers.
- **Answer Explanation and References:** After test submission, users can view correct answers along with simple explanations and reference links.
- **Company-Wise Full Mock Exams:** Complete mock tests can be designed based on specific company interview patterns.
- **User Performance Analytics Dashboard:** A dashboard can display score trends, accuracy, and topic-wise performance using charts.
- **Discussion and Comment Section:** Users can discuss questions, share solutions, and learn from others.
- **Notification and Reminder System:** Email or app notifications can remind users about upcoming tests and newly added questions.
- **Certification System:** Users can receive certificates after successfully completing quizzes or mock tests.
- **Mobile App and Offline Support:** A mobile application with offline test support can be developed for flexible learning.
